

Task 6 :- Common directories :-

/etc :- This root directory is one of the most important root directories on your system. The etc folder (short for etcetera) is commonplace location to store system files that are used by your operating system.

Ex :- The Sudoers file highlighted in screen shot below contains a list of users and groups that have permissions to run Sudo or set of commands as root user. As highlighted below are "passwd" and "shadow" files. These two files are special for linux as they show how your system stores passwords for each user in encrypted formatting called SHA 512.

```
Some notable contents of the /etc directory
tryhackme@linux2:/etc$ ls
shadow passwd sudoers sudoers.d
```

/var :-

The "/var" directory, with "var" being short for variable data, is one of main root folders found on linux install. This folder stores data that is frequently accessed or written by services or applications running on system.

Ex :- log files from running services and applications are written here (/var/log) or other data that is not necessarily associated with specific user.

```
Some notable contents of the /var directory
tryhackme@linux2:/var$ ls
backups log opt tmp
```

/root :-

Unlike the /home directory, the /root folder is actually home for the "root" system user.

```
Some notable contents of the /root directory
root@linux2:~$ ls
myfile myfolder passwords.xlsx
```

/tmp :— This is a unique root directory found on linux install. Short for "temporary", the /tmp directory is volatile and is used to store data that is only needed to be accessed once or twice. Similar to memory of computer, once the computer is restarted, the content of this folder, cleared out.

What's useful for us, in pentesting is that any user can write to this folder by default. Means once we have access to machine, it serves as good place to store things like our enumeration scripts.

```
Some notable contents of the /tmp directory

root@linux2:/tmp# ls
todelete trash.txt rubbish.bin
```

Quiz:—

1) what is directory, path that would we expect logs to be stored in?

A) /var/log

2) what root directory is similar to how RAM on computer works?

A) /tmp

3) Name the home directory of root user

A) /root

Conclusion and Summary:—

What we learned from this room is

- How to connect a linux machine remotely using SSH
- Advancing your use of commands by providing flags, switches and where to go learn about this commands (man page (manual))
- Some more commands that you frequently using is filesystem and its contents.
- A brief introduction to file permissions and switching users.
- A summary overview of Important root directories on Ubuntu linux install.

a interesting project is to see how we can use data and
how we may able to use data stored within those .
