

Task 7: - User Account Control

The large majority of home users are logged into their windows systems as local administrators. Remember from previous task that any user with administrator's account type can make changes to the system.

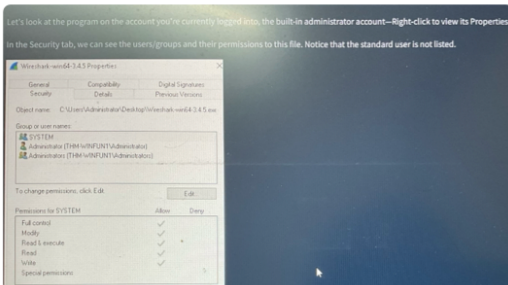

A user doesn't need to run with high (elevated) privileges on system to run tasks that don't require such privileges, such as surfing the Internet, working on word document, etc. This elevated privilege increases risk of system compromise because it makes it easier for malware to infect the system. Consequently, since user account can make changes to system, the malware would run in context of logged in user.

To protect the local users with such privileges, Microsoft introduced User Account Control (UAC). This was first introduced with windows vista and continued with versions of windows that followed.

Note: - UAC (by default), doesn't apply for built in local administrator account.

Let's look at program on account you're currently logged into, the built in administrator account - Right click to view its properties.

In Security tab, we can see users/groups and their permissions to this file. Notice that standard user is not listed.

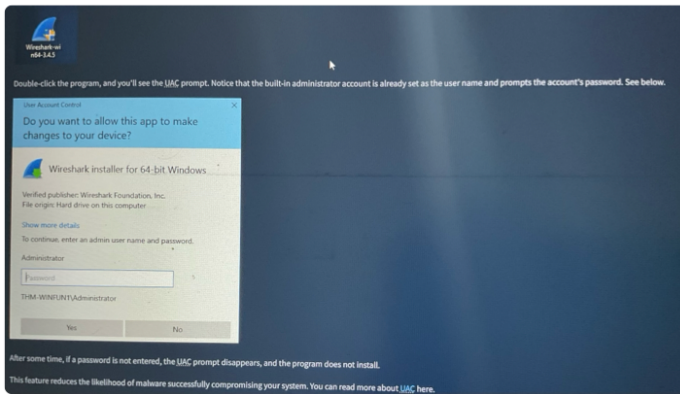

Log in as standard user and try to install this program. To this, you can remote desktop your machine as standard user account. Note: - you have username and password

for Standard user. Its visible in `ulbinger.msc`.

Before installing the program notice the icon do you see the difference? when you're logged in as standard user, the shield icon is on program's default icon.

The shield icon is an indicator that UAC will prompt to allow higher level privileges to install the program.

Quiz:-

1) what does UAC means?

A) User Account control .

Task 8:- Settings and control panel

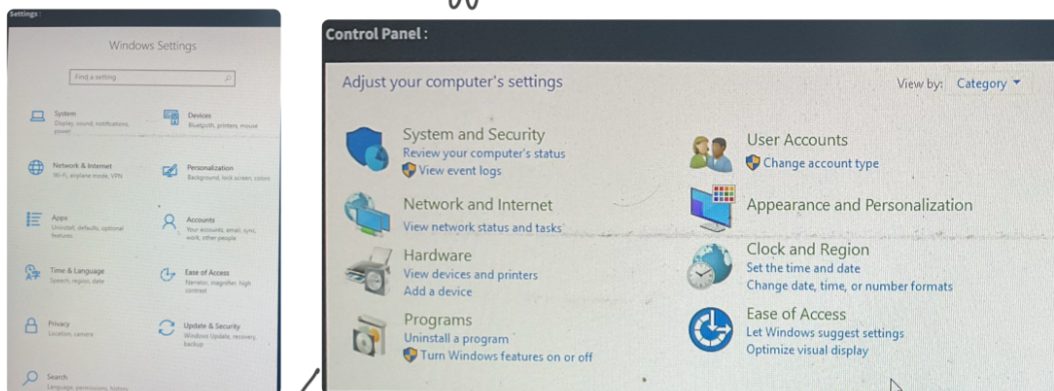

On windows system, the primary locations to make changes are settings menu and control panel.

For long time, the control panel has been go to location to make system changes, such as adding a printer, uninstall a program etc.

The settings menu was introduced in windows 8. The first windows operating system catered to touch screen tablets, and it is available in windows 10.

As matter of fact, settings menu is now primary location a user goes if they are looking to change the system.

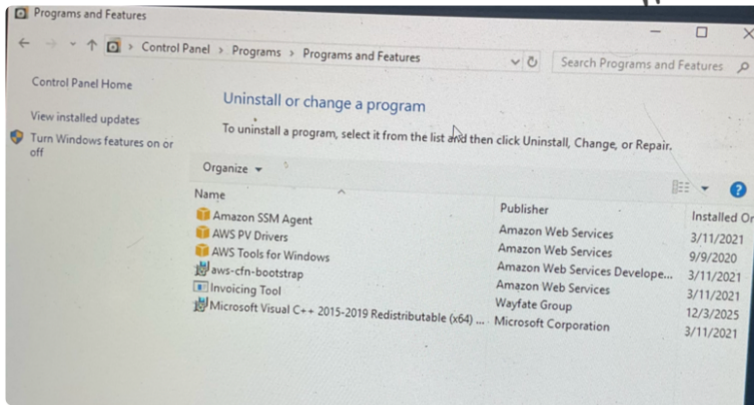

There are similarities and difference b/w two menus. Below screenshot of each.

Now if you want to see which applications are installed on the system, click **programs** button here in control panel. Then select **programs and features**.

This will list all installed applications along with their names, publishers and versions.

In this way you can verify any software that has been added to the system. The screenshot below shows installed applications of another machine through this

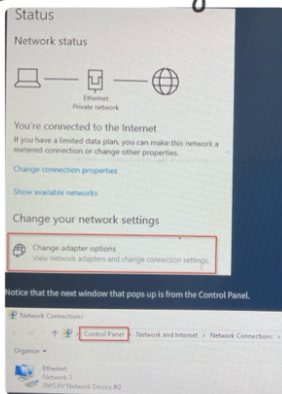

feature:-

Note:- The icons for Settings might be different version of windows on your personal device. Both can be accessed from Start Menu. See below.

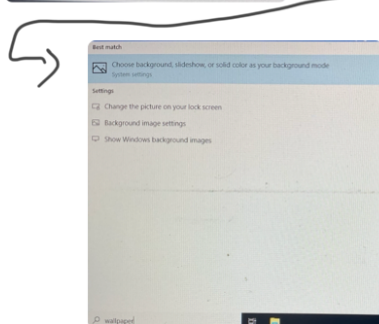

Control panel is the menu where you will access more complex settings, perform more complex actions. In some cases, you can start in Settings and end up in Control Panel.

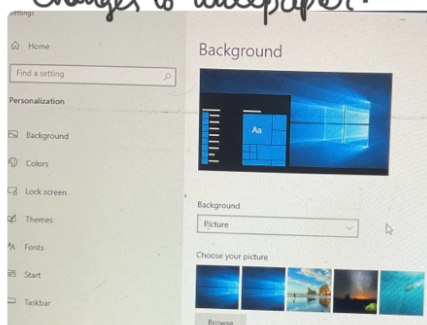

Ex:- In Settings click on Network and Internet. From here click on change adapter options.

If you're unclear which to open if you wish to change a setting, use Start menu and search for it. In example below search was 'wallpaper'. Notice that few results were returned.

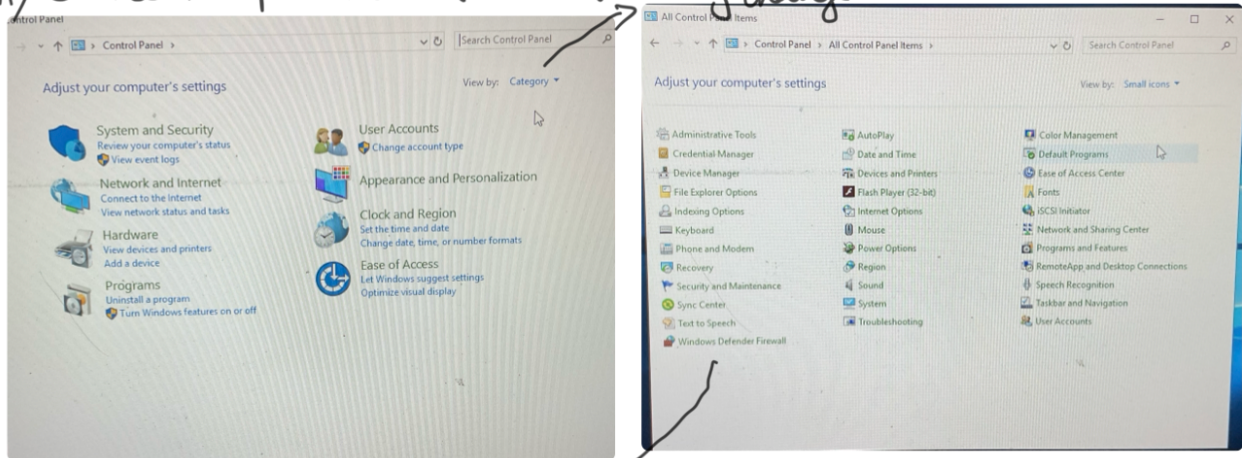

Best match, a window to Settings menu appears to make changes to wallpaper.

Dis:-

Q) In Control panel, Change the view to Small icons. What is last setting in Control panel view?

A) Search Control panel and open it, view by change it Small icon

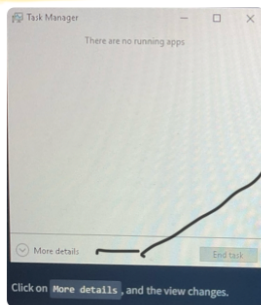

Windows Defender Firewall

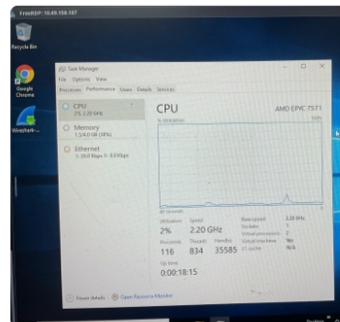

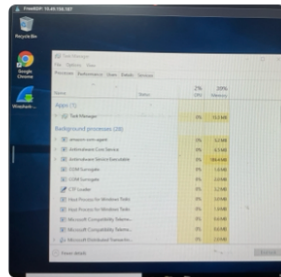

Task: - Task Manager

The last subject will be touched on this module is Task Manager.

The Task Manager provides information about Applications and processes currently running on the system. Other information is also available such as how much CPU and RAM are being utilized, which falls under performance. You can search Task Manager and open it. Task Manager will open in Simple view and won't show much information.
